Chat application - Basic Setup

- Aditya Kumar
  Chief Technology Officer, edwisor.com

We will cover with the following concepts

1) Creating the MVC structure

2) Creating the model and database connection

3) Creating the CRUD application.

Boilerplate is your way to quickly bootstrap application development

- Boilerplates can be thought like a template application which can be used to quickly start the application development.

- Any kind of reusable code like generic folder structure, libraries, middlewares etc should be included in the boilerplate application so that we don't have to waste time writing that again and again.

- Whenever you master the basics of a framework, your first goal should be to create these boilerplate applications, so that further learning and development can accelerated. Obviously, as you learn and grow you can modify these boilerplates and optimize them further.

Lets check out a very basic boilerplate application

- Let switch to the code of the application quickly.

The next steps are ...

➜   Authentication and Authorization
